

### Appendix 3

**Appendix 3.** A-wave amplitude is reduced in aralar-deficient retinas. A-wave amplitude was measured from baseline at 2, 8 and 15 of the end of stimulus. The reduction in amplitude is similar at 3 and 8 msec, when no b-wave contribution is present and at 15 msec, which is near the trough. Data are mean  $\pm$  standard error of the mean (SEM), \*\*\* $p < 0.01$  (ANOVA followed by Bonferroni's test).
